FAIR Interviews & Focus Groups: From FAIR to FAIRI(es)

Mareike Smolka, PhD candidate at FASoS

While FAIR principles are usually applied to quantitative data sets, this talk presents a [qualitative research project](#) in which interview and focus group data was made FAIR. After highlighting how FAIR was re-interpreted in the context of qualitative social science research, practical steps in data management are laid out. Finally, I ask whether sharing interview and focus group data is relevant in the social sciences beyond collecting 'brownie points' in funding proposals. For FAIR to enhance its relevance in qualitative social science research, I argue that we should add an 'I' for 'impartable' to the acronym. FAIRI researchers ('FAIRies') actively make their research data known to other researchers, students, and informants.
